Student Assistant: Data and Access Work

Department of Management, Aarhus University

The Residuals Lab at the Department of Management, Aarhus University, is hiring a student assistant, starting April 1, 2026, or as soon as possible thereafter. The position initially runs for one year.

About the lab

ResLab (<https://www.tundecserpes.com/reslab>) conducts register-based management research on how organizations implement rules and exercise authority in practice. Our projects link population registers to non-public organizational data obtained directly from government agencies and private organizations. This requires sustained access work: repeated contact, negotiation, and follow-up, often in the face of delay or resistance. As a student assistant, you contribute both to data construction and to this access work. This is a development-track position.

What you will do:

- Gain certified access to Statistics Denmark's confidential register data
- Learn and work in SAS for data crunching, and in Python or Stata for data analyses
- Clean, structure, and document register-based datasets
- Maintain careful documentation of data construction procedures
- Contact, follow up with, and negotiate access with Danish public authorities and other data custodians

Skills and qualifications:

This role requires two kinds of competence:

- Strong quantitative skills. Please include your grade in A-level mathematics (gymnasium) and any relevant coursework in statistics or econometrics
- Strong negotiation and follow-up skills in dealings with Danish public authorities and other data custodians

We offer:

- Close collaboration within the research team
- A structured development path with increasing responsibility over time
- Mentoring for students interested in research careers or applying to master's or PhD programs, including access to an alumni network of former research assistants
